

DATASHEET

Zend Server

The All-in-One PHP Application Server

From accelerating development, improving testing, and optimizing scale, Zend Server brings serious PHP to your enterprise. Business-critical PHP applications can be developed and deployed — on-premises or in the cloud — using the world's leading PHP application platform. With Zend Server, development and operations teams are equipped with the software infrastructure, tools, and best practices for productive collaboration and continuous delivery of mobile and web apps that deliver exceptional performance, reliability, and security.

Develop Better PHP Apps, Faster

Boosting performance with powerful PHP and built-in caching tools, Zend Server is a proven platform that helps organizations increase application performance, reduce downtime, and improve agility.

Streamline Issue Detection

Zend Server provides three powerful tools — code tracing, Z-Ray, and URL Insights — that help isolate bugs faster. With code tracing, you get a complete record of app state and behavior, so you don't have to spend time reproducing them. With Z-Ray and URL Insights, you can see how code and URLs are performing in real time, so you can instantly debug performance and behavior.

Improved Agility

Purpose-built to scale, Zend Server offers session clustering and cluster management, job queue management, caching, and application performance monitoring to help you match all user demands. Built-in deployment tools also make it easier to streamline, automate, and accelerate continuous delivery cycles.

Ultimate Debugging with Z-Ray

Included as part of Zend Server, Z-Ray is the ultimate PHP productivity solution. Z-Ray seamlessly plugs into your existing workflow and provides deep insights into code. With Z-Ray, you can immediately understand the impact of any code changes you are making, so you can improve quality and solve issues faster during testing phases — and after code is in production.

Certified, Secure PHP Distribution

- Create and run great apps faster
- Isolate bugs with Z-Ray and code tracing
- Automate deployment
- Monitor applications
- Optimize performance
- Gain deep insight into how code runs
- Scale on-demand
- Integrate with existing tools
